

Uninterrupted Visibility... Slip Rings provide continuous 360° Motion with No Stop Points!

Referring to the diagram below, if the Beam is aimed toward **Position A**, and the light has to be moved to **Position B**... standard searchlights will hit a mechanical stop, when attempting to move the Beam counter-clockwise, along the shorter **Path C**. When the light hits the stop, the Operator will then have to rotate the light in the opposite direction, along the much longer **Path D**, in a very time consuming manner during an emergency (Remote Electric Joystick Control Searchlights may take as long as 20 seconds or more to make this adjustment!). However, the Slip-Ring Base will provide uninterrupted motion, along the shorter **Path C**, to arrive at the same point in a mere fraction of the time!

**“Slip-Ring”
Base**
